Has experience in prototyping, marketing whales, creating corporate identity style.

## Portfolio

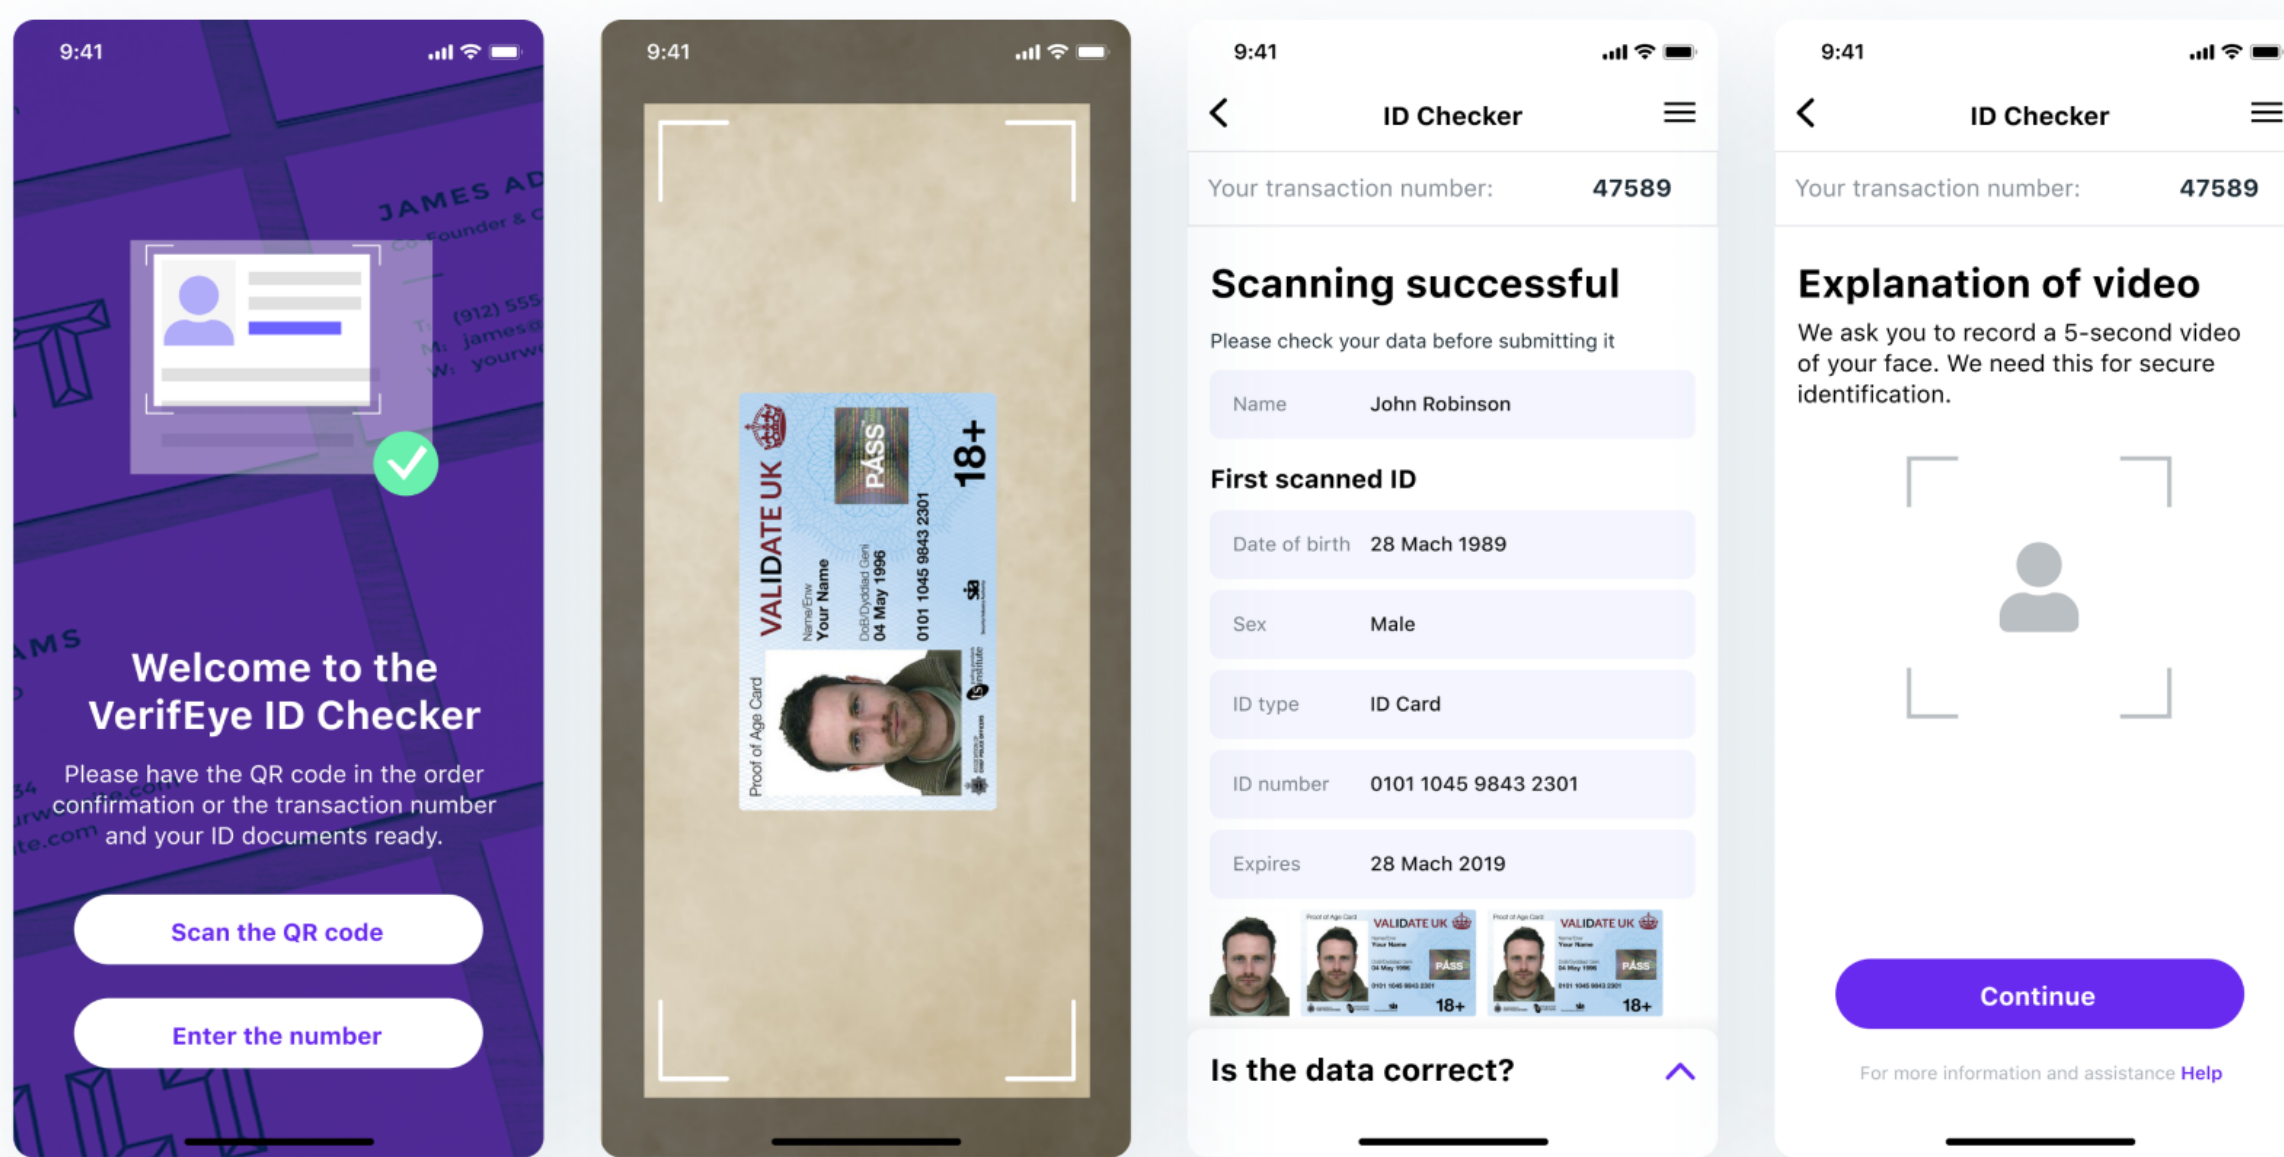

### IHS

Our customer is a global supplier of information and analytics, which have set the goal to solve the challenges engineers face. One of them is electronic components management. Obsolescence, counterfeit products, and the risks of violating environmental laws are growing, and most software on the market can't solve the problem. Another challenge is information search: engineers waste up to 40% of their time for that, using no less than 13 sources to complete a single project.

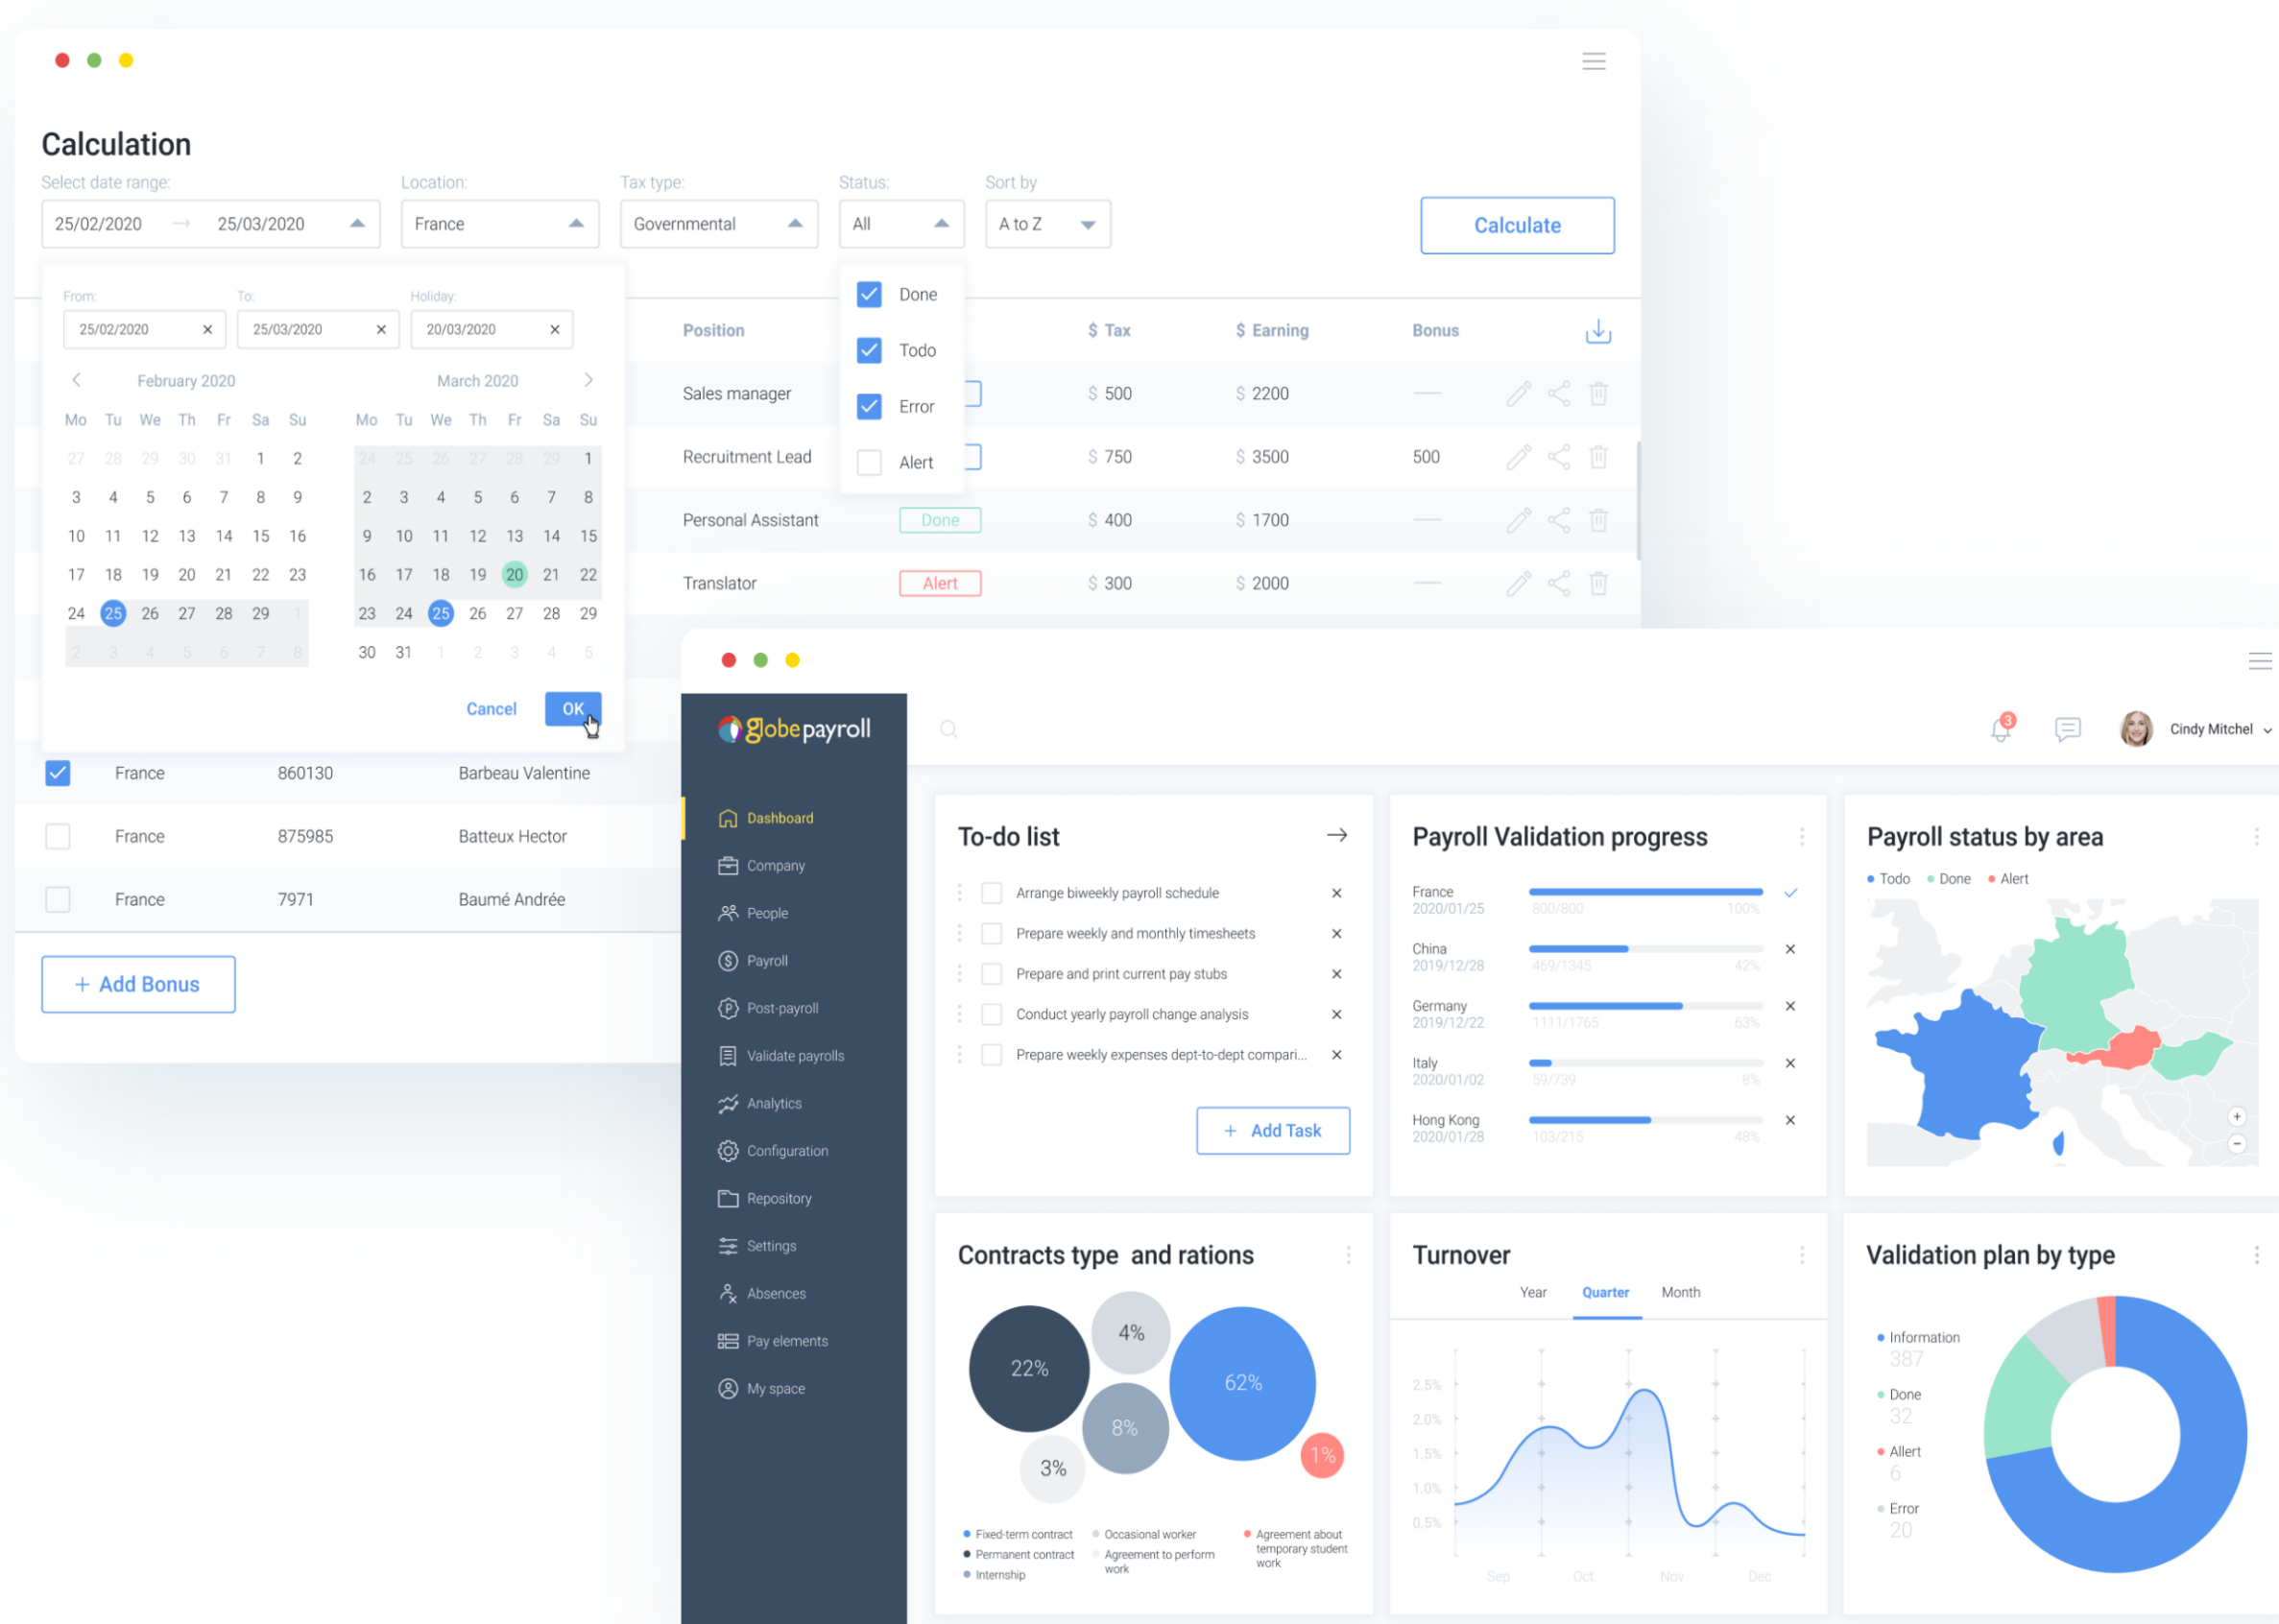

### VerifEye

In many spheres the verification of a client's identity is necessary to sign a contract with them. This procedure is often inconvenient and even costly. In order to facilitate and speed up the onboarding process, a customer suggested the idea of automating client's verification with the use of a mobile application, which would allow companies to sign contracts with clients without their physical presence.

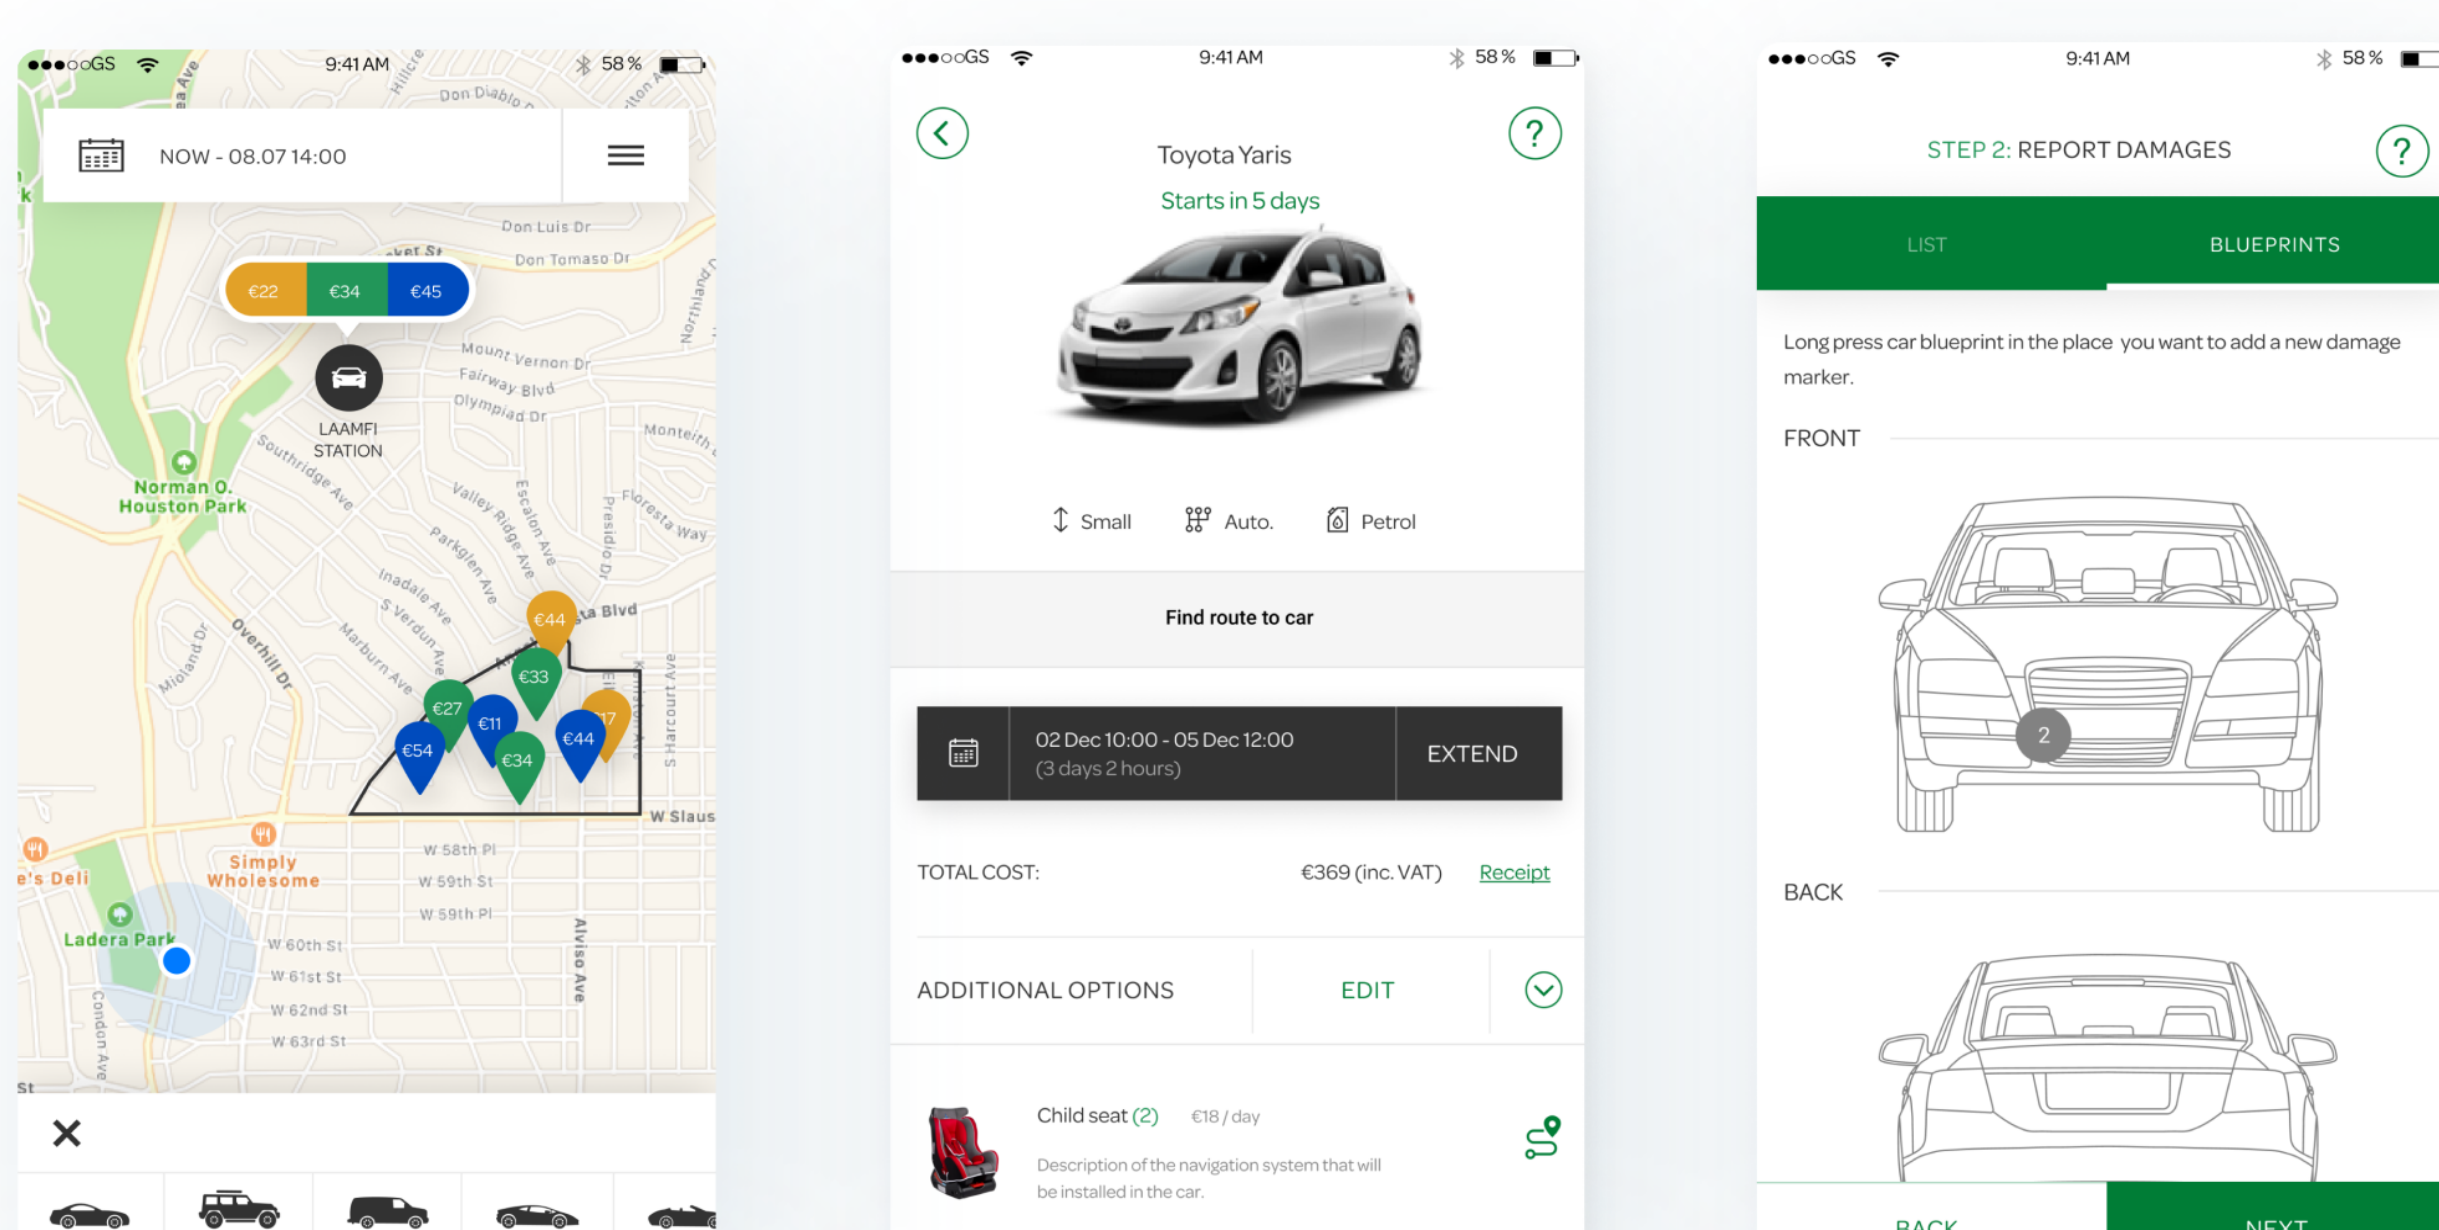

### Globe Payroll

Establishing offices in different parts of the world, international companies face difficulties in personnel management and payroll accounting in accordance with the regulations which are in force in each particular country. In order to comply with the labor legislation, companies have to use a variety of software products and hire a large staff of professional accountants and HR-specialists. Our task was to build a single software to solve the challenge.

### Europcar

The customer is a Finnish company with a simple but innovative approach to car rental, whose success sky rocketed with, at first sight, a rather trivial product. The customer entrusted Andersen with the task of building a car rental system capable of all the functionality common for other systems of this kind with two conditions: the system should be keyless and so simple and intuitive that even a child or your great-grandma can use the service seamlessly.

### Siemens

An application for data exchange, the purpose of which was to gradually move away from paper workflow. The functionality of the application depends on the type of user and his access level. Functions inaccessible to the user will be hidden or blocked, and each specific employee sees in the application those tasks and the information that he needs to work. This makes the application as simple as possible and reduces the chance of errors.
